This is a Hebrew grammar with a difference, being the first truly discourse-based grammar. Its goal is for students to understand Biblical Hebrew as a language, seeing its forms and conjugations as a coherent linguistic system, appreciating why and how the text means what it says-rather than learning Hebrew as a set of random rules and apparently arbitrary meanings. Thirty-one lessons equip learners for reading the biblical text in Hebrew. They include sections on biblical narrative, poetry, and the Masora-as well as of the text of the Hebrew Bible, lexica, and concordances. The examples and exercises are all taken directly from the biblical text, so that students can check their work against any relatively literal version of the Bible. The vocabulary lists include all of the words that occur fifty times or more in the Hebrew Bible. Special also to this Grammar are the 'enrichments': brief sections at the end of each chapter encouraging students to apply their grammatical knowledge to specific questions, issues, or passages in the biblical text. Appendices include a Vocabulary of all Hebrew words and proper names that occur fifty times or more, and a Glossary and index of technical terms-as well as

complete nominal, pronominal, and verbal paradigms, and an annotated bibliography. The learner-friendly design of this Grammar has been endorsed by faculty and by students who have used pre-publication versions to teach themselves Biblical Hebrew, both individually, in classes, and in informal groups.

Plant biotechnology applies to three major areas of plants and their uses: (1) control of plant growth and development; (2) protection of plants against biotic and abiotic stresses; and (3) expansion of ways by which specialty foods, biochemicals, and pharmaceuticals are produced. The topic of recent advances in plant

biotechnology is ripe for consideration because of the rapid developments in this field that have revolutionized our concepts of sustainable food production, cost-effective alternative energy strategies, environmental bioremediation, and production of plant-derived medicines through plant cell biotechnology. Many of the more traditional approaches to plant biotechnology are woefully out of date and even obsolete. Fresh approaches are therefore required. To this end, we have brought together a group of contributors who address the most recent advances in plant biotechnology and what they mean for human progress, and hopefully, a more sustainable future. Achievements today in plant biotechnology have already surpassed all previous expectations. These are based on promising accomplishments in the last several decades and the fact that plant biotechnology has emerged as an exciting area of research by creating unprecedented opportunities for the manipulation of biological systems. In connection with its recent advances, plant biotechnology now allows for the transfer of a greater variety of genetic information in a more precise, controlled manner. The potential for improving plant productivity and its proper use in agriculture relies largely on newly developed DNA biotechnology and molecular markers.
