## **Critical Issues in Head and Neck Oncology**

The dissection of surgical specimens from the upper aero digestive tract is often difficult due to the anatomically complicated nature of this area. Local environment dictates routes of tumour spread and surgical margins at risk and these features differ for various subsites within this part of the body. Moreover, adequate investigation of surgical specimens of the upper aero digestive tract requires knowledge of the various types of surgical procedures used for different areas and should provide data that enable the surgeon to correlate preoperatively performed diagnostic imaging with the macroscopic findings obtained postoperatively. The aim of this book is to provide guidelines for the anatomical dissection of specimens from oral and sinonasal cavities, pharynx and larynx. This is done by illustrations that combine drawings of tumours at various anatomical subsites, details of the respective surgical procedures, the specimens thus obtained, and the way to dissect these specimens as shown by colour photographs of surgical specimens handled in the way schematically outlined. The book will be of benefit for pathologists, oral and maxillofacial surgeons, ENT surgeons and residents in training for these specialties. v Contents 1 Introduction . . . . . 1 1 Head and Neck Specimens and Surgical Pathology 3 General Technical Notes 3 Anatomy 2 Oral Cavity . . . . . 5 Anatomical Subregions 5 5 Lip .

## **Multidisciplinary Care of the Head and Neck Cancer Patient**

A Doody's Core Title 2012 The head and neck is the site of some of the most diverse and histologically complex tumors in the human body. Within this small, highly specialized region, one finds a remarkable range of tissues, including skin, mucosal surfaces, soft tissue, bone, lymph nodes, peripheral and central nervous system tissue, paraganglia, endocrine organs, salivary glands and odontogenic structures. Compounding the issue, biopsies are often small, frequently distorted and difficult to orient for paraffin embedding, all of which impact evaluation and diagnosis, even for experienced pathologists. Head and Neck Pathology presents fifty cases for discussion and illustration. The cases have been selected to show the wide range of specimens seen in head and neck pathology and address some of the frequent encountered in these lesions. The goal of this unique book is to provide detailed insight into a wealth of expert experience in such cases, with in-depth review of the expert's analysis and diagnostic process supported by high-quality color photomicrographs and discussion of the diagnostic principles involved in evaluating these lesions. Head and Neck Pathology is essential reading for surgical pathologists, otolaryngologists and pathologists. In addition it will be of interest to pathology and otolaryngology residents and fellows. About the Series The Consultant Pathology series is designed to disseminate the knowledge of expert surgical pathology consultants in the analysis and diagnosis of difficult cases to the full community of pathology practitioners. The volumes are based on actual consultations and presented in a format that illustrates the expert's process of evaluating the case, including indications for consultation, the consultant's findings and comment, and discussion of the entity that amplifies the case description. Each volume in the Consultant Pathology series is authored by international experts with extensive case experience in the areas covered.

## **Surgical Pathological Anatomy of Head and Neck Specimens**

Throughout the world, sonography is often the first and sometimes the only imaging modality to be used after clinical examination. This is particularly true for the cervical region. This book reviews the sonographic features of the cervical structures, including the thyroid, parathyroids, salivary glands, lymph nodes, larynx and hypopharynx, and blood vessels. Detailed morphological descriptions of numerous pathological processes are provided, followed by thorough discussion of differential diagnostic problems. The role of all of the new technical modalities, including high-definition gray scale, enhanced color Doppler, and ultrasound contrast agents, is fully considered.
