The Vintage Ford

One of the most exciting new cars of 2004 is profiled in this beautiful book. The Ford GT is the modern version of the incredible GT40, a car created by Ford in the 1960s to beat the Ferraris at Le Mans-which they did! The success of the original GT40, coupled with its great looks, made it one of the most popular cars in automotive racing history. Ford has

revived the spirit of the original race car with perhaps its most exciting new car in 30 years-the Ford GT. The new car has lines taken straight off the original GT40 and power supplied by a 500-hp V-8. Three Ford GTs will be built in 2003 to commemorate the 1-2-3 victory at Le Mans in 1966, and the car will see limited regular production beginning in June 2004. This book includes an in-depth analysis of how the car came to be, complete with original interviews with Ford execs and engineers as well as drawings of concept cars. Also included is a short chapter summing up the origins and race history of the GT40. Also a section discussing the concepts for GT40 revivals. Many of these cars have not been revealed in publications previously.

Cost, Effectiveness, and Deployment of Fuel Economy Technologies for Light-Duty Vehicles

Trailer Life's RX for RV Performance & Mileage

The light-duty vehicle fleet is expected to undergo substantial technological changes over the next several decades. New powertrain designs, alternative fuels, advanced materials and significant changes to the vehicle body are being driven by increasingly stringent fuel economy and greenhouse gas emission standards. By the end of the next decade, cars and light-duty trucks will be more fuel efficient, weigh less, emit less air pollutants, have more safety features, and will be more expensive to purchase relative to current vehicles. Though the gasoline-powered spark ignition engine will continue to be the dominant powertrain configuration even through 2030, such vehicles will be equipped with advanced technologies, materials, electronics and controls, and aerodynamics. And by 2030, the deployment of alternative methods to propel and fuel vehicles and alternative modes of transportation, including autonomous vehicles, will be well underway. What are these new technologies - how will they work, and will some technologies be more effective than others? Written to inform The United States Department of Transportation's National Highway Traffic Safety Administration (NHTSA) and Environmental Protection Agency (EPA) Corporate Average Fuel Economy (CAFE) and greenhouse gas (GHG) emission standards, this new report from the National Research Council is a technical evaluation of costs, benefits, and implementation issues of fuel reduction technologies for next-generation light-duty vehicles. Cost, Effectiveness, and Deployment of Fuel Economy Technologies for Light-Duty Vehicles estimates the cost, potential efficiency improvements, and barriers to commercial deployment of technologies that might be employed from 2020 to 2030. This report describes these promising technologies and makes recommendations for their inclusion on the list of technologies applicable for the 2017-2025 CAFE standards.

This book presents essential information on systems and interactions in automotive transmission technology and outlines the methodologies used to analyze and develop transmission concepts and designs. Functions of and interactions between components and subassemblies of transmissions are introduced, providing a basis for designing transmission systems and for determining their potentials and properties in vehicle-specific applications: passenger cars, trucks, buses, tractors and motorcycles. With these fundamentals the presentation provides universal resources for both state-of-the-art and future transmission technologies, including systems for electric and hybrid electric vehicles.
