Metal Lathe for Home Machinists is a project-based course that provides a complete introduction to the lathe and lathe metalworking. This book takes beginners through all the basic techniques needed to tackle a wide range of machining operations. Advance through a series of practice projects that teach how to use the lathe and develop essential skills through practical application. Contained 12 lathe turning projects to develop confidence and become an accomplished home shop machinist, each project is designed to develop essential lathe skills that the reader will use again and again. All of the projects are extensively illustrated and full working drawings accompany the text. The book advances from basic projects to higher levels of difficulty as the course progresses, from a simple surface gauge to a milling cutter chuck where precision and concentricity is vital. After completing this course, the reader will have amassed a wealth of practical skills and a range of useful workshop tools and equipment, while lathe owners with more advanced skills will discover new techniques.

Bulletin, Issues 118-138

This book deals with the process of choosing and using a milling machine and its accessories. In addition to the machine itself, the accessories include the cutters, cutter chucks, work piece clamps, vices, angle plates, dividing heads, rotary tables, boring heads and other minor items. It describes what machines and accessories are available, which are essential and which can be obtained when the workshop activity eventually demands one. The usage of each machine and accessory is described in sufficient detail for the vast majority of uses that will surface in the home workshop. The actual machining process and a less-understood feature of milling, back cutting, are explained in detail. The subject of sharpening milling tools is briefly covered and a simple off hand grinder fixture that will bring new life

to a used end mill is described.

History and development of the lathe, operation, tools, and special projects. Profusely illustrated. You get everything you need to set up a lathe and get it running: history and development of the lathe, setting up and leveling the lathe, operation of the lathe, lathe tools and their application, how to take accurate measurements, plain turning (work between centers), chuck work; taper turning and boring, drilling reaming and tapping, cutting screw threads, and special classes of work. All the basics are here from sharpening drills to producing "super-finished" turned bearings, grinding valves, and turning multiple screw threads, etc.

Manual of Wage and Salary Administration

Using castings from your charcoal foundry (see Book 1 in the series: The Charcoal Foundry by David Gingery) and simple hand methods (no machine tools needed!) you can build a sturdy and accurate bed for a metal lathe. Then additional castings, common hardware items and improvised equipment will add the headstock, tailstock, carriage and all the remaining parts to complete the lathe. Illustrated with photos and drawings to show you all you need to know about patterns, molding, casting and finishing the parts. The lathe specs. include a 7" swing over the bed and 12" between centers. Adjustable tailstock with set-over for taper turning. Adjustable gibs in sliding members and adjustable sleeve bearings in the headstock. A truly practical machine capable of precision work. Once you have a foundry to cast the parts and a lathe to machine them you can tackle more exotic projects.
