Environmental Science Study Guide Concept Review Grades 9-12

Today it is widely recognized that we face urgent and serious environmental problems and we know much about them, yet we do very little. What explains this lack of motivation and change? Why is it so hard to change our lives? This book addresses this question by means of a philosophical inquiry into the conditions of possibility for environmental change. It discusses how we can become more motivated to do environmental good and what kind of knowledge we need for this, and explores the relations between motivation, knowledge, and modernity. After reviewing a broad range of possible philosophical and psychological responses to environmental apathy and inertia, the author argues for moving away from a modern focus on either detached reason and control (Stoicism and Enlightenment reason) or the natural, the sentiments, and the authentic (Romanticism), both of which make possible disengaging and alienating modes of relating to our environment. Instead he develops the notion of environmental skill: a concept that bridges the gap between knowledge and action, re-interprets environmental virtue, and suggests an environmental ethics centered on experience, know-how and skillful engagement with our environment. The author then explores the implications of this ethics for our lives: it changes the way we think about , and deal with, health, food, animals, energy, climate change, politics, and technology.

Bibliography and Index of Geology

This book is intended for use in a one- or two-semester course in environmental science, human ecology, or environmental studies at the college or advanced placement high school level. Because most students who will use it are freshman or sophomore non-science majors, the authors have tried to make the text readable and accessible without technical jargon or a presumption of prior science background. At the same time, enough data and depth are presented to make the book suitable for many upper-division classes and a valuable resource for students who will keep it in their personal libraries after their formal studies are completed. The aim of the authors is to provide an up-to-date, introductory view of essential themes in environmental science along with emphasis on details and case studies that will help students to process and retain the general principles. - This edition has approximately 50 new photographs, 15 new figures, and 55 revised figures. The most current data available is used in graphs and tables, and in most cases, dates are provided so that students can consider whether the information might have changed and why. - Every chapter in this book begins with a case stud
