Adobe Dreamweaver CS6 Revealed

In this groundbreaking study of the relations between workers and the state, Judy Fudge and Eric Tucker examine the legal regulation of workers' collective action from 1900 to 1948. They analyze the strikes, violent confrontations, lockouts, union organizing drives, legislative initiatives, and major judicial decisions that transformed the labour relations regime of liberal voluntarism, which prevailed in the later part of the nineteenth century, into industrial voluntarism, whose centrepiece was Mackenzie King's Industrial Disputes Investigation Act of 1907. This period was marked by coercion and compromise, as workers organized and fought to extend their rights against the profit oriented owners of capital, while the state struggled to define a labour regime that contained industrial conflict. The authors then trace the conflicts that eventually produced the industrial pluralism that Canadians have known in more recent years. By 1948 a detailed set of legal rules and procedures had evolved and achieved a hegemonic status that no prior

legal regime had even approached. This regime has become so central to our everyday thinking about labour relations that one might be forgiven for thinking that everything that came earlier was, truly, before the law. But, as Labour Before the Law demonstrates, workers who acted collectively prior to 1948 often found themselves before the law, whether appearing before a magistrate charged with causing a disturbance, facing a superior court judge to oppose an injunction, or in front of a board appointed pursuant to a statutory scheme that was investigating a labour dispute and making recommendations for its resolution. The book is simultaneously a history of law, aspects of the state, trade unions and labouring people, and their interaction within the broad and shifting terrain of political economy. The authors are attentive to regional differences and sectoral divergences, and they attempt to address the fragmentation of class experience.

While it has enhanced the potential for citizen agency, it has also enabled the collection and analysis of unprecedented amounts of personal data. This requires us to fundamentally rethink our understanding of digital citizenship, based on an awareness of the ways in which citizens are increasingly monitored, categorized, sorted and profiled. Drawing on extensive empirical research, Digital Citizenship in a Datafied Society offers a new understanding of citizenship in an age defined by data collection and processing. The book traces the social forces that shape digital citizenship by investigating regulatory frameworks, mediated public debate, citizens' knowledge and understanding, and possibilities for dissent and resistance.

Windows 8 Apps Revealed Using HTML5 and JavaScript

The treatment of foreign investors and of their investments on the territory of a host State is often subject to a bilateral investment treaty (BIT) signed by the national State of the investors and the host State. These BITs usually contain a clause in which the two States offer fair and equitable treatment (FET) to the foreign investors on their territory. Moreover, this clause has become a norm of customary law, implying that investors may rely on it even outside the context of the BIT. Foreign investors whose rights under this clause have not been respected may bring the State in front of an international tribunal. This book analyses not only the conventional and customary framework se the FET clause but also its scope and all its applications in the existing case law. This book tackles the standard of fair and equitable treatment by applying four conceptual frames: the

legal basis of FET, its nature as a standard, its content and finally the implications of its breach. The first two chapters explore the two classical sources of international law as possible sources for FET. The main sources of FET lie in a rich conventional framework, mainly bilateral and regional. Yet the high number of BITs does not appear to offer a uniform model of FET clauses, quite the opposite; the book offers a classification of the FET clauses found in more than 400 BITs. Having concluded that the conventional framework is essential to FET, the book turns to the examination of the possible customary character of FET and argues that the view equating FET with the International Minimum Standard is erroneous and it limits the scope of FET. Alternatively, it suggests that the FET standard is an independent standard of customary nature. Then the book looks at the nature of FET, that of being a standard and retains three direct consequences for its meaning: its flexibility, the absence of a fixed content and its evolutionary character. With these three characteristics in mind, it proceeds to the third conceptual framework, the content of FET. Although no fixed content may be given to it, it identifies and develops each one of those situations in which the FET standard has already been applied. Finally, the last conceptual framework aims at discussing the final act of a FET claim, i.e. the amount of compensation awarded. It argues that FETis a standard which balances the interests and behaviours of both the States and the investors, at the stage of compensation.

Distributed Communities on the Web

Standards play crucial roles in many different aspects of today's economy. They can define meanings of semantics, product interfaces, process steps, or performance levels. Interorganisational standards are specifications that define business-related semantics and processes, which are made accessible to other organisations' information systems. While modular organisation forms such as supply chain networks demand such standards for higher flexibility, XML-based Web Services offer a relatively new technological platform to develop such standards. The development of comprehensive interorganisational standards, however, is far from being completed. This book thus answers the questions, how interorganisational standards are developed and how different actors should get involved in it. The author uses actor-network theory to conduct two in-depth case studies on ebXML and RosettaNet. While researchers will find new explanations for the development of interorganisational standards, managers and executives will benefit from the strategic implications this book discusses.

Internet Marketing Methods Revealed

Winner of the 2015 Auburn Authors Awards Where is higher education as a field of study going in this century? How will higher education program leaders design and sustain their degree programs' vitality in the face of perennial challenges from inside and outside the academy? While in 1979 the Council for the Advancement of Standards in Higher Education (CAS) defined standards for student affairs master's level preparation, and while 2010 saw the adoption of guidelines for higher education administration and leadership preparation programs at the master's degree level, there still are, however, no guidelines that address higher education leadership doctoral programs, despite increasing demands for assessment and evaluation. This book suggests that higher education administration doctoral degree guidelines are a critical next step in advancing their program quality and continuity. It offers a review of the field's history, the condition of its higher education programs, developments from the student affairs specialization and its guidelines, and a multi-chapter dialogue on the benefits or disadvantages of having guidelines. At a time of urgency to prepare the next generation of higher education faculty and leaders, this book sets out the parameters for the debate about what the guidelines should cover to ensure the appropriate and effective

preparation of students. It also offers a useful framework for enriching the knowledge of deans, chairs, program coordinators and faculty who are engaged in program design, assessment, and revision. It will also be of interest to policymakers, the personnel of accrediting agencies, and not least graduate students within higher education preparation programs. All the contributors to this volume have the exemplary expertise, leadership experience, and a close association with higher education guidelines and standards, and have extensively contributed to the literature on higher education.

Discover how technology is affecting your business, and why typical security mechanisms are failing to address the issue of risk and trust. Security for a Web 2.0+ World looks at the perplexing issues of cyber security, and will be of interest to those who need to know how to make effective security policy decisions to engineers who design ICT systems – a guide to information security and standards in the Web 2.0+ era. It provides an understanding of IT security in the converged world of communications technology based on the Internet Protocol. Many companies are currently applying security models following legacy policies or ad-hoc solutions. A series of new security standards (ISO/ITU) allow security professionals to talk a common language. By applying a common standard,

security vendors are able to create products and services that meet the challenging security demands of technology further diffused from the central control of the local area network. Companies are able to prove and show the level of maturity of their security solutions based on their proven compliance of the recommendations defined by the standard. Carlos Solari and his team present much needed information and a broader view on why and how to use and deploy standards. They set the stage for a standards-based approach to design in security, driven by various factors that include securing complex information-communications systems, the need to drive security in product development, the need to better apply security funds to get a better return on investment. Security applied after complex systems are deployed is at best a patchwork fix. Concerned with what can be done now using the technologies and methods at our disposal, the authors set in place the idea that security can be designed in to the complex networks that exist now and for those in the near future. Web 2.0 is the next great promise of ICT – we still have the chance to design in a more secure path. Time is of the essence – prevent-detect-respond!
