Palliative Care for Non-cancer Patients

“This 5th edition is an important achievement; it is a symbol of commitment to the field of palliative nursing, where we have been and where we are going.” - Betty Rolling Ferrell, PhD, MA, FAAN, FPCN, CHPN
From the Foreword
The aging population has only grown since the first edition of this comprehensive and seminal publication nearly 20 years ago. Based on the need to humanize rather than medicalize the illness experience for patients, this text delves into palliative care beyond the specific diseases affecting the patient. Instead, content focuses on the whole person and family. Palliative patients struggle with chronic, debilitating, and painful conditions, and grapple with the fact that life as they knew it has already passed away. Families and friends reciprocally suffer, not knowing how to help and therefore become the secondary victims of the disease. This is not the challenge of a lone nurse, or a single physician, therapist, or social worker. Rather, palliative and hospice care requires the expertise and unique roles of an interprofessional team to help the patient and family strengthen their resilience, continue to find meaning and purpose in life, and cure what can be cured. Palliative Care Nursing, Fifth Edition, delivers advanced empirical, aesthetic, ethical and personal

knowledge. This new edition brings an increased focus on outcomes, benchmarking progress, and goals of care. It expounds upon the importance of the cross-disciplinary collaboration introduced in the previous edition. Every chapter in Sections I, II, and III includes content written by a non-nursing member of the interprofessional team. Based on best-evidence and clinical practice guidelines, this text presents comprehensive, targeted interventions responsive to the needs of palliative and hospice patients and family. Each chapter contains compassionate, timely, appropriate, and cost-effective care for diverse populations across the illness trajectory. Key Features The expanded new edition offers current, comprehensive, one-stop source of highly-relevant clinical information on palliative care Life-span approach: age-appropriate nursing considerations (e.g. geriatric, pediatric and family) Includes disease-specific and symptom-specific nursing management chapters Promotes a holistic and interdisciplinary approach to palliative care Offers important legal, ethical and cultural considerations related to death and dying Case Studies with Case Study Conclusion in each clinical chapter New to The Fifth Edition: An expanded chapter on Palliative Care incorporates most up to date scope and standards, information on Basic and Advanced HPNA certification, self-reflection and self-care for nurses. A chapter on Interprofessional Collaboration Instructor Resources: Power points and Test bank

Patients with End-stage Renal Disease

Diabetes Care

This work, a valuable resource on prostate and testicular cancers, not only offers basic information about recent clinical and experimental developments concerning these tumors, but also features ``consensus'' reports that present summations of the knowledge and experience of internationally acclaimed clinicians and scientists working in specific areas of the field. The book provides a framework for assessing the clinical relevance and therapeutic potential of the various new developments discussed. Among the specific topics covered by contributors are: diagnosis and management of localized prostate cancer; oncogene expression in prostate cancer; biopsy techniques and cytology; management of seminoma; the role of lymph node dissection in testicular cancer; and pathological classifications of testicular tumors.

The Patient with End Stage Renal Disease

Contains the 4th session of the 28th Parliament through the session of the Parliament.

Nursing Times, Nursing Mirror

The specialty of palliative care has traditionally grown out of oncology. This study considers the needs and experiences of patients dying from, for instance, stroke, heart disease or dementia by drawing on a range of specialties in medicine.

Palliative Care Nursing

Approaching Death

During the past 40 years there have been major conceptual and technical advances in the domain of dialysis methods and renal/organ transplantation for long-term treatment of patients with End-Stage Renal Failure (ESRF). This now enables better defined, more selective strategies of treatment to be undertaken, according to patient-specific criteria such as age or underlying renal disease also taking into account the lifetime duration of these treatments. For many patients this implies necessary successive changes of mode of therapy depending on their availability, occurrence of medical/technical complications or failure and social-environmental and economic factors. This rationale has inspired the structure of this volume which is divided into four sections: 1/ A descriptive overview of the various modes of renal replacement therapy (RRT): Extracorporeal dialysis/filtration, peritoneal dialysis, kidney and multi-organ transplantation. 2/ Most appropriate indications and use of these methods, respective advantages, drawbacks and outcome in children, pregnant women and elderly patients 3/ In diabetic patients and in patients with hereditary/congenital diseases. 4/ The ethical issues generated by this new domain in Medicine by limitations in treatment facilities or medical dilemmas for acceptance, best technical choices, withdrawal or termination of RRT in individual patients. Finally, contributors from Eastern European Countries, Africa and Far Eastern Countries analyse the current status of RRT in their respective geographical area and the ways and means required for a wider implementation of RRT in thus far lesser economically developed countries where the great majority of the populations still have no access to these life-saving therapeutic procedures.

Nursing Times

Cancer Pain Relief

Cardiomyopathies are the most featured cardiac pathologies in the twenty-first century, that threaten public health and burden healthcare budgets. This book is composed of the main topics on pathophysiology, general forms and specific types of cardiomyopathies and it also introduces new research in the field. Specific forms with or without genetic inheritance are discussed separately to attract the readers' attention on these topics. Well-known medical follow-up strategies occur ineffective at the end-stage heart failure, however, new surgical approaches can be an alternative for these patients to get a chance at the last crossroad and to improve their life quality and survival and also to gain or prolong time until possible heart transplantation.

Patient safety and quality issues in end stage renal disease treatment

This practical manual seeks to address the need for broader, better management guidelines for end-stage heart disease. It contains both standard, time-tested methods, as well as more current, cutting-edge alternatives. There are medical therapies that utilize positive inotropic agents, adrenergic blocking agents and other drugs; surgical options, such as revascularization and valve surgery; myocardial replacement therapies that restore function through ventricular assist devices, flow pumps and artificial hearts; and myocardial enhancement therapies, including dynamic cardiomyoplasty and ventriculectomy.

End stage renal disease. 1984 | publ. July 1986

In our society's aggressive pursuit of cures for cancer, we have neglected symptom control and comfort care. Less than one percent of the National Cancer Institute's budget is spent on any aspect of palliative care research or education, despite the half million people who die of cancer each year and the larger number living with cancer and its symptoms. *Improving Palliative Care for Cancer* examines the barriers—scientific, policy, and social—that keep those in need from getting good palliative care. It goes on to recommend public- and private-sector actions that would lead to the development of more effective palliative interventions; better information about currently used interventions; and greater knowledge about, and access to, palliative care for all those with cancer who would benefit from it.

American Journal of Epidemiology

In this special issue, reviews of various aspects of HD therapy were submitted from all over the world. In particular, reviews for recent advances in this area from leading experts have been contributed to the book *Hemodialysis*. In order to deliver optimal patient care, nephrologists need to understand and be highly knowledgeable in the mechanisms of multiple aspects of hemodialysis therapy. Moreover, this book will provide an important source of information for beginners and experts, basic scientists and physicians who want to have a true update on current clinical practice in hemodialysis.

NURSING CARE AT THE END OF LIFE

Excerpta Medica

When the end of life makes its inevitable appearance, people should be able to expect reliable, humane, and effective caregiving. Yet too many dying people suffer unnecessarily. While an "overtreated" dying is feared, untreated pain or emotional abandonment are equally frightening. *Approaching Death* reflects a wide-ranging effort to understand what we know about care at the end of life, what we have yet to learn, and what we know but do not adequately apply. It seeks to build understanding of what constitutes good care for the dying and offers recommendations to decisionmakers that address specific barriers to achieving good care. This volume offers a profile of when, where, and how Americans die. It examines the dimensions of caring at the end of life: Determining diagnosis and prognosis and communicating these to patient and family. Establishing clinical and personal goals. Matching physical, psychological, spiritual, and practical care strategies to the patient's values and circumstances. *Approaching Death* considers the dying experience in hospitals, nursing homes, and other settings and the role of interdisciplinary teams and managed care. It offers perspectives on quality measurement and improvement, the role of practice guidelines, cost concerns, and legal issues such as assisted suicide. The book proposes how health professionals can become better prepared to care well for those who are dying and to understand that these are not patients for whom "nothing can be done."
